

Feature Suggestions

Sales & Profit Tracker · ideas for what to build next, most useful first

Most valuable for a Facebook Page / Daraz seller

1

Courier and cash-on-delivery tracking [Recommended first]

Record the courier (Pathao, Steadfast, RedX), the tracking number, and whether the courier has actually paid you. A "money still with couriers" figure on the Dashboard shows cash you are owed. Builds on the existing Pending status.

2

Invoice and packing slip [Quick win]

Print a branded invoice for each order to put in the parcel, using the same approach as the Statement's print page.

3

Customer insights

Show each customer's lifetime spend, order count and return rate, and flag customers who return or cancel often. Helps avoid fake cash-on-delivery orders, a common problem for Facebook sellers.

4

Low-stock alerts on the Dashboard, and purchase records

Record stock purchases from suppliers (supplier, quantity, cost). Stock and cost of goods then update from real purchases instead of manual edits.

Money and reports

5

Monthly profit goals

Set a target and show a progress bar on the Dashboard.

6

Comparison with the previous period

Show "+12% vs last month" on the figure cards.

7

Product variants (size or colour)

Needed for clothing or anything that comes in several versions.

Quality and operations

8

Activity log

Record who created, edited or deleted each order. With Staff and Admin roles, this matters for accountability.

9

Automated database backups

Schedule a daily MySQL dump; the data currently lives only in a Docker volume.

10

Frontend tests

The backend has tests but the frontend has none. Adding Vitest for the money calculations would catch mistakes in the figures.

Recommendation. Start with **#1, courier and cash-on-delivery tracking**: it has the biggest real-world impact for this kind of business and fits naturally with the existing Pending status. **#2, invoices**, is a quick win to do next.
